

Soft Robotics Tech Talk with Harley Green

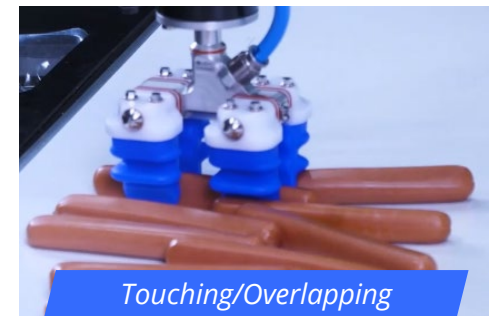

Protein Automation Solutions with 3D Vision, Artificial Intelligence, and Soft Grasping

mGripAI™ is a revolutionary, easy-to-integrate robotic food automation solution that combines 3D Perception, Soft Grasping, and Artificial Intelligence to enable high-speed picking, sortation, singulation, and packaging from bulk food presentations to bins, boxes, totes, or conveyance.

mGripAI provides hand-eye coordination for industrial robots enabling system integrators and OEM machine builders to automate complex production processes in the food industry, freeing food processors from their primary challenge - a scarce and expensive labor force.

mGripAI allows robots to easily individually pick products that are touching, overlapping or shingled, or piled on a conveyor. We will discuss the current process for human workers vs the Soft Robotics' *mGripAI* solution. Other topics discussed will be on food safety, applications, real-time picking and object tracking, intelligent picking and machine learning with *mGripAI*.

This ground-breaking technology is solving problems in ways that no one thought was possible.
